

Forklift Fork Positioners

Fork Positioner for Forklift - The fork positioner is a hydraulic apparatus which could allow the the one driving to be able to work the lift truck without leaving the seat. They are constructed out of high quality materials and are intended to be able to endure the most challenging operations and work surroundings. Side shifting models have the added ability to be able to laterally position the arms or the entire load in order to facilitate much more accurate lifting and position in a quicker and much more efficient method.

The fork pocket is rather unique and enables the operator to securely swing the forks into position without any worry of destroying the positioning cylinders. This could allow the operator the choice to perform independent or simultaneous fork movement, dependent upon the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are needed. Standard OEM carriages could be converted into fork positioners on available units.
